

# CS421/621 Lab03

## Designing a simple and scientific calculator using *Bootstrap* and *JavaScript*

Design a simple unit converter using Bootstrap and JavaScript. Include form objects from bootstrap library and develop methods to perform the following conversions

- **Convert kg to pounds**
- Convert km to miles
- Convert Fahrenheit to Celsius

You can insert a bootstrap button to perform the conversion, or you can develop the code to perform it simultaneously. If your application works simultaneously, you can get a bonus point.

You need to include a bootstrap grid for different conversion options listed above.

### Submission

The submission is not required for this lab. If you want to earn some bonus points to add your final grades, you can submit your project through the Canvas.
